

Custody Management System

Program explanation

Ahmed Alaa

Purpose and business need

I developed this program to organise the issue, return and status monitoring of items assigned to recipients, while recording recipient details, items, quantities and movement references. It brings master data, issue and return forms, reports and movement logs into one interface.

Operational use — The program is currently in operational use across five factories, running with high efficiency.

It addresses the need to know what was issued, to whom, what has been returned and what remains outstanding, while supporting coded and uncoded employees and contractors through an intermediary.

My role

I translated the custody workflow into practical screens, starting with employee and item data and continuing through issue, return and movement monitoring. I developed the program step by step, with forms for different recipient types, review reports, and user and permission management screens.

Main functions

Master data — Maintain employee and item records, including codes, names, departments, job titles, contact details and item descriptions.

Issue forms — Use separate paths for coded employees, uncoded employees and contractors through an intermediary. Record the actual recipient, storekeeper, date, time, shift and notes.

Movement items — Record item codes, descriptions and quantities, and add multiple items within one issue form.

Returns and status — Search for assigned items by recipient type and details, record returns and notes, and monitor returned and outstanding statuses.

Monitoring and reports — View movement, status and item summaries; use daily, recipient and shift reports, Excel and PDF exports, and a filterable movement log.

Administration — Use user and permission screens and a navigation list for the sites or factories shown in the interface.

Workflow and operational value

Custody Management System

How the program is used

- 1. Prepare master data** — Record employee and item details in the master data screen for use when recording movements.
- 2. Choose the issue path** — Select a coded employee, uncoded employee or contractor through an intermediary, according to the recipient's circumstances.
- 3. Record the movement** — Enter the actual recipient, storekeeper, date, time and shift, followed by items, quantities and notes. Multiple items can be added before saving the issue form.
- 4. Record the return** — Open the return screen, select the recipient type and search for the assigned items, then record the return details and notes.
- 5. Monitor statuses** — Use dashboard summaries and reports to follow returned and outstanding movements and review activity by recipient, shift or period.
- 6. Review the reference** — Filter the movement log by date, movement type and user, and export available reports to Excel or PDF when needed.

Operational value

The program helps make the relationship between recipients, items, quantities and custody status clearer, with an organised reference for issues and returns. Reports make outstanding items and recorded movements easier to follow, supporting control and daily monitoring.

Screens that illustrate the project

The screenshots cover the dashboard, issue paths by recipient type, the return screen, reports, master data, movement logs, and user and permission management.
