

# Warehouse Audit System

Program explanation

Ahmed Alaa

## Purpose and business need

I developed this program to support warehouse operations review, from uploading reports and examining movements to documenting inventory counts and presenting management summaries. It brings review functions into one interface, with filters for date, site and material.

**Operational use** — The program is currently in operational use across three animal feed manufacturing plants, running with high efficiency.

It addresses the need to examine sales, transfers, receipts and material reports together, review quantities and differences, and present information more clearly for operational monitoring and decisions.

## My role

I translated warehouse management needs into practical screens for uploading, reviewing and documenting data and preparing reports. I developed the program step by step, improving results presentation, export tools, and user and system settings around operational requirements.

## Main functions

**Report uploads** — Select a report type and date, upload Excel files, and review an upload history with options to view, replace or delete files.

**Movement review** — Review sales, transfers and receipts, and track materials and consumption, with search, filters and a focus mode.

**Inventory documentation** — Use inventory documents and count documentation to review quantities and differences, alongside production-date tracking tools.

**Management monitoring** — Use dashboard charts and executive summaries by date, site and material, alongside screens for department administration, activities and reports.

**Exports and administration** — Export Excel, PDF and PNG reports where available, and manage users, roles, permission screens, settings and the activity log.

# Workflow and operational value

## Warehouse Audit System

### How the program is used

- 1. Select the report** — Choose the report type and the period or report date needed for review.
- 2. Upload the data** — Upload an Excel file through the report upload screen. Use the upload history to review uploaded files or replace them when needed.
- 3. Review movements** — Open sales and transfers, receipts or material tracking, and filter by site, material and date to focus the review.
- 4. Document inventory counts** — Use the inventory screens to record counts, review quantities and differences, and document the review.
- 5. Read the summaries** — Use the dashboard and executive reports to review summaries and charts and compare data across the sites represented in the reports.
- 6. Export the report** — Export results in a format offered by the screen, for sharing or retaining as a review reference.

The review workflow starts with report file uploads. The different modules provide a path from detailed data to monitoring summaries.

### Operational value

The program helps organise movement and inventory review into a clear workflow and makes data and differences easier to monitor. Filters, reports and exports support operational control, management communication and decisions.

### Screens that illustrate the project

The screenshots cover report uploads, review, inventory, dashboards, reports and administration, with examples of the interface on desktop and mobile.
